

TCS Style Python Practice: Smallest and Largest in an Array

Goal: Practice array input, loops, conditions, and min/max logic for coding rounds.

Common TCS Input Pattern

First line = n, the size of the array. Second line = n space-separated integers.

```
Input:
7
2 3 4 5 6 1 8
```

1) Find the Largest Number

```
n = int(input())
arr = list(map(int, input().split()))

max_value = arr[0]
for i in range(1, n):
    if arr[i] > max_value:
        max_value = arr[i]

print(max_value)
```

Output: 8

2) Find the Smallest Number

```
n = int(input())
arr = list(map(int, input().split()))

min_value = arr[0]
for i in range(1, n):
    if arr[i] < min_value:
        min_value = arr[i]

print(min_value)
```

Output: 1

3) Find Smallest and Largest Together

```
n = int(input())
arr = list(map(int, input().split()))

min_value = arr[0]
max_value = arr[0]

for i in range(1, n):
    if arr[i] < min_value:
        min_value = arr[i]
    if arr[i] > max_value:
        max_value = arr[i]

print("Smallest:", min_value)
print("Largest:", max_value)
```

Output: Smallest: 1, Largest: 8

Memory Trick

Task	Symbol	Meaning
Find smallest	<	Update when current element is smaller.
Find largest	>	Update when current element is bigger.

GitHub commit idea: Add TCS-style array min and max practice problem with explanation.
